To . N. Chapman . M. D. &c. &c.

This imperfect essay, is inscribed, not on account of its intrinsic merit, but as an humble tribute, and attestation of that respect, which the overflowing heart of a grateful private pupil, is proud to acknowledge. In testimony for him, both as a man & a teacher of medicine, And that your life may be long, illustrious, & happy, is the wish, of

Your most sincere friend:
And grateful pupil:

Observations upon the common inflammatory
Dysentery

This disease is arranged by Cullen in his 1st Class (Præcox) under the 5th Subgenus & Genus 41st. He divides it as a subinflammatory catarrhic fever, attended with frequent stools. *Alba*, *lucida*, *terrena*, *longus* &c. The natural feces here for the most part retained.

To this opinion of the pathologists, I dissent, and have expressed in account of the general catarrhic nature which has been ascribed to it. The writers who consider Cullen's Pathology of Dysentery erroneous, suppose that it is only catarrhic when accompanied with dyspepsia, & that under all the other forms it proceeds either as an epidemic, or a disease produced by accidental circumstances. The symptoms of the disease as described by most writers are as follows, commencing most frequently with cold shiverings & the other symptoms of fever, next the local affections appear as *tenesmus* & *longus*. It frequently happens that soon last makes them appear more first & perhaps is frequently the disease is induced by ~~acidity~~ acidity, and continues to a degree of flatulence, want of appetite, nausea & vomiting, after these the symptoms

+ tenes

long of pain above described. Sometimes a slight
Diarrhoea is the first appearance. As the disease advances
the griping becomes more severe the evacuations more
frequent & uniformly attended by Tenesmus & Tenesmus
& flatulencies is not uncommonly an attendant. But the
most distressing symptom is Tenesmus, which is
usually succeeded by an appearance of
Tenesmus & Tenesmus. The matter discharged from the in-
testine is sometimes frothy mucus, sometimes blood & mu-
cus intermixed, such a cheese like substance, & sometimes
the discharge is pure blood.

These are the usual appearances of the evacuations
from the intestines during an attack of Dysentery. Occa-
sionally it happens that small intestine pieces of
as frog off they are called Syphylas & this discharge
is usually attended with temporary relief to the
sufferer.

There may also be marked with the usual symp-
toms of Dysentery. It is to be observed that the dis-
charge is the same as of dysentery & action of the pulse
as is generally to be met with in inflammatory diseases.
It has been observed by most writers on this subject that

about this time the disease seems to be disposed to come to a crisis. But it is not uncommonly the case that this critical period is much more protracted. That this period of the disease it has not been checked it is progressing it for the most part takes on a more dangerous form.

Added to the increase of tumour & tenacious and great addition of strength, the extremities, tension of the abdomen, the clammy sweat, the rough skin, a small feeble pulse, & an acrid discharge from the bowels similar to the wasting of meat. These are generally unfavorable symptoms. & altho' sometimes they are not followed by death; yet these are always the precursors.

The disease when it is about to terminate favourably, is attended with a remission of fever, the organs become moist & relaxed, the evacuations are more natural, & less frequent, attended with very little tumour & Lassness.

There is another form of this disease spoken of by several writers upon this subject, in which there is no discharge from the bowels whatever. This variation of the bowels is supposed to be produced by the inflammation of the bowels rising to a great degree, as to transudate

The Census of
the population
of the United States
for the year 1880
has been published
by the Census Bureau
of the Department of
Commerce and Labor.
The report is in two
volumes. The first
volume contains the
general statistics of the
population, and the
second volume contains
the statistics of the
different States and
Territories. The
statistics are given in
great detail, and are
very valuable for
reference.

the first of the year 1800

1800 was a year of great distress and
scarcity in the West Indies, and it is
probable that the same will be the case in
the future. The people of the West Indies
are now suffering from the effects of the
war, and the scarcity of food is becoming
very great.

I have been thinking of you very much lately
 and wondering how you are getting on.
 I hope you are well and happy.
 I have been very busy lately with my work
 but I have managed to find some time to write
 to you. I am still in the same place
 and doing the same work. I am still
 very much interested in my work
 and I hope to be able to do it
 for many years to come. I am still
 very much interested in my work
 and I hope to be able to do it
 for many years to come. I am still

save salvation. I have no experience. Some practitioners
recommend it very highly, whilst others speak in doubt-
ful terms of it. However high the commendations that
have been bestowed upon it, I should not be disposed to
use it often.

That it would prove effectual I have no doubt.
But as long as we have it in our power, to cure the dis-
ease by means that are less violent, in their operation
I should never resort to it. As a dernier resort it may
be had recourse to, but, unless in other circumstances in
this form of Dysentery.

Diet As this is a disease of high inflammation ac-
tually, it becomes a matter of primary importance to attend
to the diet of the patients. A very low diet should be
prescribed, consisting of articles prepared of as little in-
flammatory action as possible. Such as Slippery Elm Bark
Barley or Rice water. Flax seed Tea. Peppermint
The use of these drinks throughout the whole course
of this disease will be attended with no inconsiderable
benefits. They promote perspiration, give us a rapid
stool. & induce also an anodyne effect.
